Discovery Network Assessment

Devfense DNA (Discovery Network Assessment) provides an inventory and topology of your network to help your organization understand the state of your IT environment, how people connect to it, and what kinds of security improvements may be required.

Devfense DNA (Discovery Network Assessment) combines the tools, methodology, and expertise to help organizations assess their IT systems.

Gain better knowledge and control of your network. Devfense DNA:

- Includes an onsite inspection of your facilities' equipment and IT environment. Reviews items such as your systems, power supply, cables, room security, drainage and more.
- Discovers and assesses the condition of your network's IP-based physical hardware (servers, workstations laptops), ports, networked printers, firewalls, and their operating systems
- Identifies and addresses potential network-based vulnerabilities due to equipment wear, poor hardware configuration or patch-management deficiencies
- Provides a report on your IT assets with a network diagram to let you better operate and maintain your network.

Industry Standards and Network Expertise

Our knowledgeable, experienced network security professionals use industry-standard best practices. Your organization is in good hands when you choose Devfense DNA.

Preparation for Network Security Compliance

Security breaches cost \$90 to \$305 per lost record.

- Forrester Research

About Boonbox

Boonbox, a division of Pacific Coast Information Systems Ltd. (PCIS), offers packaged infrastructure and network solutions. These solutions help organizations address security and compliance issues within today's complex IT environment.

PCIS has the tools, expertise and proven processes to speedily identify and resolve security compliance issues at a lower cost.

Devfense DNA identifies the state of your network with a combination of award-winning tools and knowledge of qualified IT experts.

Devfense DNA is the first step in meeting security compliance mandates such as PCI DSS. Many government and industry regulatory bodies require organizations to be proactive about maintaining their networks. But corporate changes, restructuring, staff turnover, and an evolving IT environment can lead to poor institutional awareness of network assets and topology.

Devfense DNA reports ensure that organizations understand the physical state of your network infrastructure and applications. Then they can take further proactive steps such as a focused Network Security Assessment to find and remove network vulnerabilities. Discovery Network Assessment is the first step in security compliance.

Comprehensive Approach to Protecting Your Organization

Devfense DNA can be combined with Devfense NSA and Devfense WSA (Web Security Assessment) to provide your organization with a holistic approach to protecting your IT infrastructure and web applications. Security improvements to one part of your IT security landscape while other aspects remain vulnerable is simply not an option. Organizations can be targeted by multi-faceted threats from multiple sources. Knowledgeable IT security experts can ensure that your organization deploys effective solutions that will help ensure protection, privacy and operational continuity.

Begin to secure your network today with Devfense DNA.

Devfense helps organizations understand the state of their network and how people are connecting to it.
